

Main Objectives of TF II in OP2.1 and OP2.2

Main Objective	Scientific Goal	Measures of Success / Deliverables
<ul style="list-style-type: none"> ▪ Integrated scenarios for long-pulse operation with PFC heat load control, efficient particle exhaust, and impurity screening 	<ul style="list-style-type: none"> ▪ Control of divertor/baffle loads and actuation of heat load distribution ▪ Studies on particle exhaust and optimization of plasma fueling schemes 	<ul style="list-style-type: none"> ▪ Demonstration of safe divertor scenarios to avoid overloaded plasma-facing components ▪ Determination of trim and/or control coil currents required to correct error fields ▪ Demonstration of effective pumping, high divertor compression, and qualification of fueling actuators ▪ Demonstration of long-pulse operation (1 GJ energy turnaround)
<ul style="list-style-type: none"> ▪ Development of long, stationary divertor detachment scenarios with and without impurity seeding 	<ul style="list-style-type: none"> ▪ Creating conditions for detachment by tailoring edge plasma conditions and impurity seeding ▪ Compatibility of stationary detachment with high-performance scenarios ▪ Development of detachment scenarios with efficient exhaust 	<ul style="list-style-type: none"> ▪ Demonstration of scenarios with long, stationary divertor detachment; in particular, for the high-mirror, high-iota and standard configurations ▪ Characterize the conditions under which detachment is possible ▪ Achieve rapid transition to detachment

<ul style="list-style-type: none">▪ Exploration of scenarios compatible with carbon-free operation and tungsten PFCs	<ul style="list-style-type: none">▪ Migration (erosion, deposition) of tungsten-based materials and assessment of operation limits▪ Edge scenario development for metallic plasma-facing components	<ul style="list-style-type: none">▪ Definition of the operation limits associated with plasma-facing components containing tungsten materials▪ Characterize the scrape-off layer retention for tungsten impurities (eroded from baffle and heat shield)▪ Determination of erosion effects due to seeding impurities▪ Characterize enrichment/accumulation for low-Z and high-Z impurities
<ul style="list-style-type: none">▪ Development of wall conditioning procedures	<ul style="list-style-type: none">▪ Optimization of glow discharge cleaning, boronization, and qualification of dedicated wall conditioning discharges with ECRH/ICRH	<ul style="list-style-type: none">▪ Condition walls to enable plasmas with high density gradients necessary for high performance
<ul style="list-style-type: none">▪ Reference discharge	<ul style="list-style-type: none">▪ Validation of edge models▪ Tracking of plasma/wall conditions▪ Analysis of configuration dependences (incl. reversed field operation)	<ul style="list-style-type: none">▪ Regular performance of a standardized discharge with defined diagnostic coverage throughout campaign
